## BUSINESSPAK+

For the Radio Shack TRS-80 Model 100

INTRODUCTORY  
PRICE!  
Complete  
package  
includes  
manual and  
six cassettes!

\$89.95

six programs designed for  
the businessperson

- each on its own cassette
- 120 page manual in  
simple language.

With BUSINESSPAK+ the Model 100 is virtually a complete tool for the manager or executive. Picture how this added capability will help you.

WRITE+: Instead of merely a text preparation device the Model 100 becomes a real word processor. Margins . . . side, top and bottom. Title page, topic headings, page numbers, and even headers and footers. You can even right justify and print multiple copies. It has over 36 features and countless format possibilities.

EXPNS+: By simply entering expenses into eighteen categories, you get a twelve day spreadsheet, giving totals for each day, and category. Names of rows and columns are instantly changeable, and the sheet becomes a budget or even a financial report. Replication across the columns, cumulative totals, and automatic growth or decline rate projection, make EXPNS+ an excellent planning tool. And, all the math is built right in.

GRAPH+: Prints out Bar, Line and Pie graphs of any EXPNS+ report on the DMP-100 dot matrix printer. Shows the percents on the pie chart and values on the others.

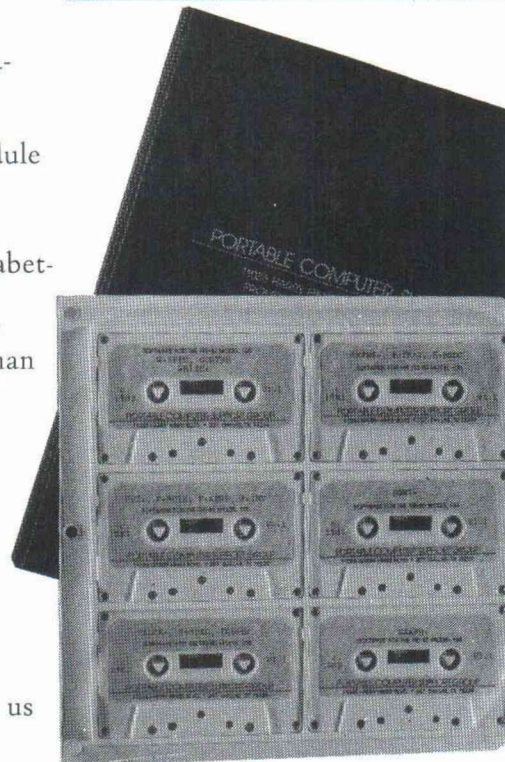

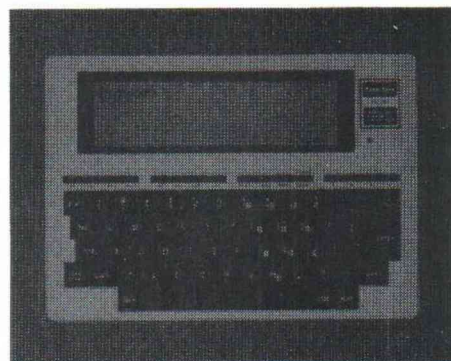

TELEX+: From any phone send any text file to any Telex machine in the world. Just enter the receiving Telex number. Send Mailgrams for next day delivery to any address at reduced rates through the Action Telex system.

PUT+: Lets you list any information in an organized fashion. It prompts for each entry and very rapidly creates addresses or schedule items and even inventory.

SORT+: Allows you to sort any list you compile with PUT+ alphabetically or numerically from any category in the entry. It can sort large files up to 20 times faster than an all Basic program.

MASTERCARD/VISA/COD

PCSG provides hotline software support for the Model 100. Give us a call at 1-214-351-0564.

# Join Us For A World Of Portable Computing.

We're glad you picked up this inaugural copy of *PCM — The Portable Computing Magazine* and we hope you'll like us.

We are the people who publish *the Rainbow*, the leading magazine for the TRS-80 Color Computer. By deciding to publish a second magazine devoted exclusively to one model of the TRS-80 family, we plan to adapt the formula which carried *the Rainbow* to the top of its field.

In a word, we expect to be a success because of *you*. We won't confuse you with a lot of computer gibberish, we don't plan to devote a lot of space to a whole number of arcane "secrets" of the Portable Computer that you probably won't use and will care about even less. But, most important of all, we expect to have a user-oriented magazine that will answer your needs and interests.

We hope this inaugural issue of *PCM — The Portable Computing Magazine* will give you some idea of what we will be trying to do.

For example, Robert Frowenfeld's lead article on making graphs with the Portable Computer and the Radio Shack Color Graphics Printer should give you some idea of the versatility built in to your new Model 100. Robert, one of our contributing editors, also begins a series called "On The Road," which will give you both some ideas and practical methods for using your Portable while away from home base.

We think the software built into the Portable Computer is super. This month we'll show you how to be sure the sorting utility works that is printed in the manual that came with your 100. That is, we'll alert you to a possible problem that could occur. In future issues, we'll be showing you other things you can do with the "ADDRESS" and "SCHEDULE" programs that are built in.

We firmly believe the Portable Computer isn't all for business. But, Vincent Lord has a couple of short programs which you can use in figuring out business-type problems. We hope you will find them useful. Also, there is a full-scale loan amortization program that will let you know a great deal about money at interest.

Did we say that the Portable Computer can be fun, as well as useful? Well, there is our *NIM* program, too. Great fun. Try to beat your computer. Let us know if you do.

And, no one has ever disputed the educational value of a computer. So, our *QUIZ* program can teach Spanish or French, geography or just about anything else. It is built to drill the youngsters around you on just about any subject. All you have to do is plug in the questions and answers.

There are a few other things here, too. Including advertisements. Take note of them. And, please, mention our name when you do place orders. It will help us grow and, in growing, we will be able to better serve you.

Yes, do please consider *PCM — The Portable Computing Magazine* as *yours*. We welcome your suggestions and thoughts. We encourage you to send us your programs and hints. Address them to PCM Submissions Editor. (We'll pay for contributions.) And, please use our "Letters" column to tell all the other Portable Computer owners out there things you have found out — or ask something you want to know. (No, don't look too hard for the "Letters" column this month, it isn't here. We have to have a magazine before we can get any letters, don't we?)

And, we want to make you aware of the *PCM Certification Seal*. It will be your assurance of the working existence of a product for your Model 100.

You may be interested in learning about some of the people who are on the masthead of this issue. Our managing editor, Courtney Noe, was *the Rainbow's* first editorial employee. He has a lengthy and varied background in magazines and journalism and a Model 100 he proudly calls his own. Jerry McKiernan, our art director, planned the "look" of this magazine and also has worked on *the Rainbow*, among other publications.

Charlotte Ford, our advertising manager, will assist you with any advertising needs you may have and Ivanka Kleier, our customer service manager, will help you with any subscription questions you may have. Pat Hirsch, our general manager, will always be ready to assist in almost anything.

But the most important member of our staff is *you!* We look to you for help, input and contributions. We will listen to your wants and needs. And, together, we hope to have an outstanding magazine that will support an excellent computer.

We look forward to working for you and with you.

—The Editors

## Portable Computing Will Be Your Key To A New World

---

**H**ello. And welcome to *PCM*. We believe you're going to like us.

For the record, *PCM* is brought to you by the same people who publish a magazine for the TRS-80 Color Computer called *the Rainbow*. And many of the things which have made that magazine the leader in its field will apply to *PCM*, too.

As you can obviously tell from the heft of this issue, we intend for *PCM* to start sort of small and grow with you and your portable computer. And, while we believe we have enough information in these pages to keep you busy, don't be surprised if, a year from now, you end up holding a magazine that's more than 100 pages.

We believe there is a great future for your portable computer and for you. *PCM* intends to be part of that future and to share it with you.

This being our inaugural issue, I thought you would be interested in what *PCM* will be and what it will not be.

First of all, we are an independent magazine. We are not *sponsored* by any company or software firm. That's important, because we plan to carry extensive reviews of all sorts of products—hardware, software and firmware—that will be available for your Portable Computer. In so doing, we will be able to be independent and to give you fair and accurate information about anything you might consider purchasing.

Second of all, we *are not* in the software business. Yes, our plans include the possibility of offering you programs which appear in *PCM* on tape at some

time in the future. But, we will not be hawking products of our own.

Why not? Because we wish to remain independent. And we want you to be certain that, when we evaluate a product, we will evaluate it without concern about anything that we might be selling.

Third, you will find that we have no ax to grind with any company, individual or organization. You should be aware that this includes Radio Shack and Tandy Corp. When we see something good, we'll say so. And when we see something we don't like, we'll say that, too. But, in keeping with good journalistic practice, when we *do* print opinion, we'll label it as such.

Most important of all, we intend to be a readers' magazine. We will publish programs you can use—and we'll ask you to send along those in which you think others will be interested. Yes, we will pay you for them. Just let us know whether you want remuneration.

We intend to have a lively and informative "Letters To The Editor" feature, an "insider's" column so you'll know the latest news of what's happening that affects your Portable Computer, tutorials on how to use the various functions and many more features—some of them on specific areas of interest.

But, most of all, we intend to have programs. Programs you can key in and use. We'll give you information about how a program works (whenever possible) so you can learn while typing them in. But, remember, *PCM* is a magazine that you will be able to *use*. We'll be short on theory and long on practical applications.

Also, don't expect to see a lot of material (or any, for that matter) about "other" computer systems. We're a specialized publication devoted to the Portable Computer. That means simply that you won't have to "wade through" a lot of other material to find something of interest to you. And, while some programs—due to memory requirements—may not run on *your* own machine, all will be written to run on your own Portable Computer. That's a big bonus to you, because everything here is applicable to you!

You should know there is genuine enthusiasm here at *PCM* for the concept of portable computers. And, too, there is excitement about the TRS-80 Model 100 Portable Computer. Yes, we will probably get into some of the other portables. We find that many applications are similar.

We believe you will share our excitement about portable computing. It opens up avenues which never were open before. We hope you will consider us to be *your* magazine, that you will tell your friends and associates about us and that you will mention our name when contacting advertisers. That's important to us, but it is important to you, too. As we grow, we will be able to offer more pages, more information and more portable computing insight than we can without your support.

We look forward to our association with you.

Please contact us if we can help or work with you in any way.

—Lonnie Falk

# Skyline Software

PUBLISHERS OF QUALITY MICROCOMPUTER SOFTWARE

## The Porta™ series from Skyline— to help you work faster and better!

**PortaCalc®** — Model 100 “electronic spreadsheet” with 15 column by 26 row workspace! Full use of the built-in function keys to save, load, screen print, report print, or to look behind the data at the formulas in use.

Full arithmetic operators including exponentiation, absolute value, integer, summation, and averaging. Calculations are done to 14 digits of precision and displayed up to 9 digits. User selectable decimal place from none through seven—not just one, two, or floating! Formula replication is included to allow fast creation of worksheets.

Worksheets may be saved, loaded, or merged using the computer's memory or cassette. Often used templates can be saved in memory for instant recall. DIF file creation feature allows transfer of worksheets or data to **VisiCalc** on your big machine back at the office!

Printer driver gives more control for report formatting.

Comes with extensive documentation in padded 3-ring binder. Includes tutorial, detailed reference section, and executive level sample templates. Fully illustrated with screen prints, examples, and hints.

**PortaStat®** — Correlation, regression analysis, covariance and descriptive statistics package, designed to be a working tool for today's businessman. Data can be input from cassette, memory, or keyboard. Interactive with **PortaCalc** data files! Thoroughly documented, includes tutorial.

**PortaFin®** — Present value, net present value, future value, annuities, interest factors, loan constants, internal rate of return and more! This user-friendly package prompts you for the needed input data, then gives you the answer to your loan or investment problem! Interactive with **PortaCalc** files, allowing you to “read” cash flow data from memory. Keyboard or cassette input also available.

**PortaMax®** — The powerful ‘simplex’ method of linear programming. Find the optimum ‘mix’ for a given set of constraints. Interacts with **PortaCalc** files to avoid time-wasting repetitive data entry. Tutorial, examples, and bibliography included.

**PortaMed®** — an ‘electronic clipboard’ for the medical professional. Already in use at a major hospital. Patient medical record keeping and report generation. Clearly documented, and easy to use.

**PortaFolio®** — Stock and bond valuation, betas, Macaulay's duration, yield to maturity, bond swap calculations, and much more. All in an easy to use program, interactive with **PortaCalc** data files. Supplied with comprehensive instructions and reference manual.

All **Porta** series programs are supplied on cassette and require 24K RAM.

**Pricing** — **PortaCalc** is \$69.95, all others are \$44.95 each.

### SPECIAL OFFER:

Computer cassette recorder, with cable for Model 100, and a dozen data cassettes with cases — \$49.95 with any **Porta** software purchase.

Model 100 is a trademark of Tandy Corp. VisiCalc is a trademark of VisiCorp. DIF is a trademark of Software Arts.

# PLOTTING GRAPHS with the MODEL 100

By Robert Frowenfeld

One of the biggest advantages of having a computer is the ability to perform operations that would normally be either too tedious or even impossible to do manually. Plotting graphs has always been one of those things that I knew a computer could do more quickly and accurately than I could by hand. Whether plotting a mathematical equation, your corporation's sales history, or even the Dow Jones industrials average, a well designed graph drawn by a computer can be very helpful. Instead of pouring over columns of figures, the person viewing a graph can immediately pick out trends and/or changes and get a much better understanding of what the numbers actually mean.

I've found that using the Model 100 Portable Computer along with the Color Graphics Printer (CGP-115) produces super multi-color graphs. The CGP-115 uses roll paper which is 4" wide. While four inches may not seem like it would be wide enough to produce an acceptable graph, the CGP-115 has the ability to print as many as 80 characters on a 4" line, and can rotate characters 90 degrees in any direction.

The accompanying program was originally designed to run on a TRS-80 Model 16, and has been successfully adapted to run on the Model 100. The program takes up a little less than 6K of memory and will easily run on a machine equipped with 16K. In order to run this program, two data files must be created. One defines the graph titles, X and Y axis scales and axis labeling information. The second file (see Listing #3) contains the data to be plotted. When setting up the two files, a special convention must be used for the file-

names so that the plotting program will know where to find them. In this example, I named the *format* file TESTF.DO and the *data* file TESTD.DO. The extension ".DO" indicates that the files are ASCII character files, similar in nature to any document file created with the *TEXT* program that comes installed on the Model 100. When naming the files, the same name must be used with the last character in the name of the format file; an "F" (for format) and the last character of the data file a "D" (for data). Since the Model 100 allows up to six characters for the filename, the format and data files can have unique titles up to five characters in length with the last character an "F" or "D." When the program is run it will ask for the filename to be plotted. In the example here, where the format and data files are named TESTF.DO and TESTD.DO respectively, the proper response is to enter the four-character name TEST. Once the ENTER key is pressed the CGP-115 starts plotting.

To generate the format file, I used the *TEXT* program that comes with the Model 100. The format file items and their type (alpha or numeric) are listed in Table 1. Following is a description of each item's purpose:

Table 1

Item #	Description	Type
1	Main Graph Title	Alpha
2	Sub-title	Alpha
3	X-Axis Title	Alpha
4	Y-Axis Title	Alpha
5	Grid	(Y or N)
6	#X Units	Numeric
7	#Y Units	Numeric
8	Smallest X Value	Numeric
9	Largest X Value	Numeric
10	Smallest Y Value	Numeric
11	Largest Y Value	Numeric
12	#X Divisions per unit	Numeric
13	#Y Divisions per unit	Numeric
14	Number of Lines	Numeric
15	X axis label format	Alpha
16	Y axis label format	Alpha
17	Point Markers	(Y or N)
18	Line Label Print Size	Numeric (0—2)

Following is a brief description of the function each of these items plays in formatting the graph.

1—4) These titles can be of any length. The number of characters should be kept reasonably small, especially in the case of the Y axis title so that it will fit within the graph boundaries.

5) If a grid overlay is desired this should be a "Y," otherwise "N." This can be rather handy when interpolating the value of a continuous function. In this example, a grid was not used and "N" was entered.

6—7) This is the number of units to be labeled on each axis. Do not include the first point to be labeled (the origin) when counting; the program does this automatically.

8—11) These are the lowest and highest values on the X and Y axes. Note that these are not necessarily the maximum and minimum values of the data points to be plotted, but the lowest and highest values that will be labeled on the axes. The program won't check to see if your data actually fits within these limits, so these values should be selected with care.

12—13) This is the number of divisions into which each unit on the X and Y

# RESPONSE FREQUENCY VS. TIME

DEMONSTRATION PLOT

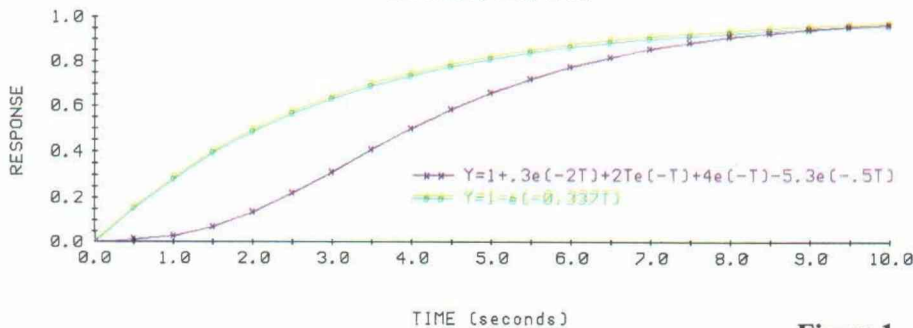

Figure 1

axes is to be divided. In the case of the example, a value of 2 was specified for the X axis and 4 for the Y axis. This resulted in two and four divisions between each labeled numeric value on the X and Y axes respectively. A value greater than or equal to 1 must be specified for these values.

14) Any number of lines can be specified here; the example uses two.

15—16) The format for the printing of the values along the X and Y axes has the format "m.n," where m is a series of "#" characters used to represent the number of digits to the left of the decimal point and n is a series of "#" characters to represent the number of digits to be printed to the right of the decimal point. For example, if the numbers to be printed along one of the axes were in the range of 0—100, then the appropriate format would be "###." In the example used for the plot appearing in this article, formats for the X and Y axes were chosen as "##.#" and "##." respectively. Had the Y axis format been "###.##," for example, the values would have appeared as "0.00," "0.20," "0.40," ... "1.00."

17) If the value of this is specified as "Y," then a marker will be placed at the posi-

tion of the data point. The marker is specified later on in the line specifications. The example in this article uses point markers. If markers are not desired, use the character "N."

18) This is the size of print used to print the line titles and can have an integer value of 0, 1, or 2. Using the value 0 will result in extremely small print, 20 pitch, or 80 characters on a 4" line, to be exact. Size 1 is used in the example and results in 10 characters per inch. Size 2 can be used and prints large letters (6.7 characters per inch).

For each line, the following information must be supplied:

- |                     |          |
|---------------------|----------|
| a) Line Type        | Numeric  |
| b) Line Title       | Alpha    |
| c) Next Line        | (Y or N) |
| d) Number of Points | Numeric  |
| e) Line Color       | Numeric  |
| f) Marker Character | Alpha    |
| g) X Title Position | Numeric  |
| h) Y Title Position | Numeric  |

a) The line type has a value of (0—15) and corresponds to the line type described in the CGP-115 manual. There are 16 different types of lines, ranging from a solid line to several types of dashed lines to a very fine dotted line. In the accompanying example, the line type used was 0; this generates a solid line.

b) The line title can be of any length. Care must be taken to position the title so that it fits within the boundary of the graph.

c) Next line indicates if there are more lines to plot. The example here contains two lines. For the first line a "Y" is used to indicate that there is a second line to plot. The second line is also the last line so a "N" is used.

d) This is the number of points the line contains. Our example's lines each contain 21 data points.

e) Line color is indicated as follows: 0 = black, 1 = blue, 2 = green, 3 = red.

f) The marker character must be specified, and can be any one of the 96 characters the CGP-115 can print. This includes: 0—9, A—Z in both upper and lower case, and some special symbols such as !"#\$%&'()\*+,-./:;<=>?@[. Even if marker symbols are not desired, a character (even a blank) must be declared.

g,h) These are the X and Y coordinates of the starting position of the line title (item "a" above). These are defined in terms relative to the scales printed along the X and Y axes. If, for example, we had wanted to print the titles at the bottom of the graph (below the X axis) the Y coordinate would have been in the neighborhood of -0.3. Keep in mind when determining the starting position for the line title that a sample line ½" long will be printed at that position with the title printed just to the right.

The data file (Listing 3) was generated by the program in Listing 4. The format of the data file is as follows. The first item in the data file is the number of lines for which there is data; two in this case. Next, each line of the sequential data file consists of a series of X,Y pairs of numbers separated by a comma. After the last X,Y pair is the point 999.999,999.999; this tells the program there is no more data for this line and the next data is for the following line.

With a little bit of practice, anyone with a Model 100 and CGP-115 can generate neat, impressive line graphs. I use a modified version of this program to chart my stocks by plotting prices, volumes and moving averages. I know several people who are using this program to keep an eye on sales figures and productivity performances.

## GOLDLABEL™ BLANK CASSETTES

★PREMIUM 5 SCREW SHELL  
★COMPUTER DATA QUALITY ★LOW NOISE  
★MADE IN USA ★GUARANTEED

1 DOZEN C-10 LENGTH \$8.50 + \$2.50 shpg.  
2 DOZEN C-10 LENGTH \$16.00 + \$3.50 shpg.

1 DOZEN C-30 LENGTH \$12.50 + \$2.50 shpg.  
2 DOZEN C-30 LENGTH \$23.50 + \$3.50 shpg.

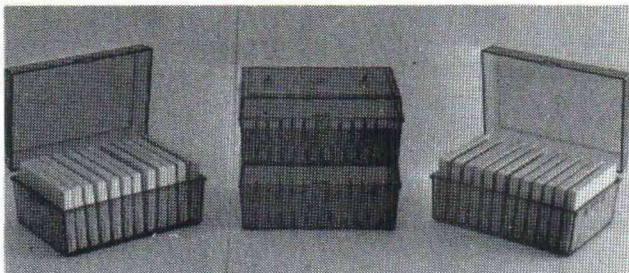

Individual storage boxes (sold only with cassettes) \$2.40 per dozen.  
CASSETTE CADDY: \$3.95 + \$2.00 shpg.  
2 for \$7.00 + \$3.00 shpg.

Free shipping on one caddy with each dozen cassettes.

Foreign orders include shipping at 16 oz. per dozen tapes/9 oz. per caddy/13 oz. per dozen boxes. Shipped in U.S. by UPS.

## CASSETTE CADDY

TIRED OF MISPLACED TAPES AND A CLUTTERED WORK AREA? TRY OUR HINGED TOP SMOKED PLASTIC CADDY THAT HOLDS 12 TAPES IN ONE HANDY LOCATION. EDGE LABELS INCLUDED TO IDENTIFY TAPES.

Visa and Mastercard accepted (include expiration date) Orders paid by cashier's check, money order or bankcard are shipped within 48 hours. Personal check takes 1-2 wks. No COD. Some foreign sales are restricted. Texas residents add 5% tax.

# Telecommunications and the Model 100

By Bob Rosen

The Radio Shack Model 100 is a forerunner to a new generation of briefcase computers. I have traveled with a Color Computer, and after a while found it to be quite a hassle.

Before buying the Model 100, I saw many features I wish I had available before. I spend a lot of time on airplanes, and the Model 100 would seem an excellent way to type in long listings for any computer and then upload them later. The text editor is excellent; I'm glad to see it in ROM. The BASIC looks fantastic, with plenty of I/O commands for the RS-232 and modem ports; with 16-digit precision, it's great for scientific applications.

The area I was mainly interested in was the telecom features, and the balance of this review will concentrate on that area. First, I was using an 8K machine which booted up and allowed only about 5K for the user. I called up a BBS that had download programs on it and felt that it filled up too fast. As far as I'm concerned, the memory upgrades are somewhat expensive, but competition from the prophesied Model 100 lookalikes will probably take care of that problem. Five K is just not enough memory for any serious telecom work. If you *are* serious about this, 32K of memory is—in my opinion—a must.

I hooked the 100 to my Color Computer with no problems. I loaded up ColorCom/E in my Color Computer and easily downloaded a small text program from the Model 100; going the other way was just as easy. When I tried chatting with another CoCo user, I ran into a problem in that I was unable to get the Model 100 to line feed. I'm sure

that two Model 100s connected together would have twice the problem. It would have been nice if Radio Shack had built in a user selectable automatic line feed insert capability at least to give its own display a line feed. A good example of a telecom program with this capability is Eigen's ColorCom/E.

I connected the modem cable to the Model 100 and had no problem checking into several bulletin boards. My real disappointment came when I tried to upload a file. A couple of bulletin boards took the file without problems, but several of them would drop characters at the beginning of each line during an upload. I noticed there was no pause between lines sent from the Model 100, and apparently most BBS's do a little processing between each line received.

I tried uploading to a Flex system, using the BUILD command, and I was completely out of luck because the BUILD utility does a disk access after each carriage return. An option to send a line at a time would have been helpful, as well as some sort of programmable line delay. I even ran into an Atari-based BBS that wouldn't read any characters at all because it seemed to have a certain amount of intercharacter delay.

The bottom line of all this is that the upload feature is going to need a little work before it is universally usable. Tandy should have field tested this feature on something besides a Model II and CompuServe.

As far as the attractive features of the machine are concerned, the download feature worked well. I really liked the constant memory feature. I had to shut the computer off in a hurry several times, and the ability to store and call up numerous files without disk or tape adds real value. The Model 100 is impressive looking and fits well in an office. It's nice to be able to take a computer to work without having to rent a

truck. The 40 x 8 display is easy to read, and I really liked the ability of the display to flip to the previous page of text during the telecom mode. I wish Radio Shack had incorporated this into the text editor. I also really liked the auto dial feature; it worked satisfactorily for me dialing at 20 pulses per second, although it can be slowed down to 10 PPS.

A few other things I observed about the machine that might be useful to the potential buyer are listed here. I removed a cover on the bottom of the machine and found a ROM socket (I hope they will sell a spreadsheet soon) and a bus connector. I would like to see some articles pertaining to the use of that bus connector, as well as theory of operation for these new low power chips. I would like to point out that the cassette cable is the same as the one used on the Color Computer, and the Model 100 loads at the same rate (1500 baud) as the Color Computer, which is really quite good. One other thing I noticed is that the modem seemed a little insensitive when trying to receive. I was using a marginal phone line and was able to transmit just fine; however, everything I received was garbage. A different modem and terminal on the same line yielded good results.

To sum it all up, I believe the Model 100 is a good computer with lots of potential—with a little work, it could be a great computer. I mean for the criticism in this article to be constructive, and I hope that The Shack will bring about enhancements quickly. Otherwise, we will again have to rely on outside vendors. I'm not so sure that other manufacturers will leave such a fantastic concept alone for very long. I foresee several Model 100 lookalikes ready for release before Christmas. Maybe by the time this article is released we will see one.

*(Bob Rosen is president of Spectrum Projects and runs three Color Computer bulletin boards.)*

# Financial Ratios Can Help Determine Corporate 'Soundness'

By Vincent Lord

---

**F**inancial ratios are conveniently used to determine the manner in which a company is operated. If you deal with investments, such ratios are useful guidelines to determine the financial condition of the company. Since these ratios are based upon the balance sheet, the data you need is often published with the annual report. The

net profit to sales ratio and the return on investment ratio are two means of determining profitability; the current ratio is a statement of liquidity. The program listed below allows the calculation of the ratios which when compared with previous years' ratios can help determine the "soundness" of a company.

The program will accommodate numbers up to those of the largest U. S. corporation without the unnecessary "cents." The output is in the form of fractions. If you wish to express the results in percentage, change lines 260, 360, and 460 to PRINT USING "###.##+" ;XX\*100, where XX is the ratio, i.e. PS, RI, or CR. Good luck with your investments.

## **NOW YOU CAN HAVE FUN WITH YOUR 24K MODEL 100**

### **4 games for your enjoyment:**

**BLOCKADE** — Your 'snake' grows longer as you hit the randomly appearing targets on the screen — as long as you don't run into yourself, a wall, or your opponent! A one or two player real-time game with optional sound and three speeds of play.

**REVERSI** — A 'board' game in which you try to outflank your opponent to end up with the most squares at game's end. Play against the computer or another human.

**FRANKENSTEIN ADVENTURE** — Find all of the necessary equipment to awaken the monster. The clues are hidden and the pitfalls are many!

**ALEXIS ADVENTURE** — Sail the seas and traverse the islands to recapture your kingdom. Chart your course or you may sail on forever!

- Powerful Built-In Software and Extended BASIC Language
- Self-Contained Direct-Connect Telephone Modem
- 8-Line by 40-Character Display
- Full-Size Typewriter Keyboard
- Retains Data When Power "Off"
- Memory Expands to 32K

Brace yourself—Radio Shack just redefined the concept of personal computing. Our new TRS-80 Model 100 is so small, it'll fit in your in-basket. Yet, it's as powerful as many desktop micros. The built-in BASIC language is the most advanced ever from Microsoft®, and features full string handling, complete file operations, multi-dimension arrays, 14-digit double-precision accuracy, 240 × 64 dot-addressable graphics, a five-octave sound generator and much more. The Model 100 includes a parallel printer port, an RS-232C serial interface and a cassette port. Model 100's built-in direct-connect modem even allows you to access any computer by phone. If you're not a programmer, "instant-on" software in ROM lets you use your Model 100 as a personal word processor, telephone auto-dialer, address book and appointment calendar. Come see the most revolutionary computer since the TRS-80 Model I at over 6500 Radio Shack stores and participating dealers, including over 400 Radio Shack Computer Centers nationwide.

# Glancing at the New 100's Version of BASIC

**W**ell, I've just sat down and taken a good look at the Model 100's version of BASIC that (as with all other TRS-80s) was developed by none other than our good friends at Microsoft. This version of BASIC has a few new commands and that's what we're going to examine today. While there are many new and specialized commands available for such esoteric uses as accessing the communications port, renaming and merging files, etc., I'm going to key on those commands that the "average" BASIC programmer (if there is such a thing) will find the most useful and interesting.

Looking at all the commands available (in alphabetical order), the first "stranger" I see is the BEEP command. Using this command will cause the sound generator in the Model 100 to emit a tone for 1/2 second. This certainly comes in handy when designing a program to signal a user when he or she has made an error. Say, for example, that we have use for a subroutine that requests a response to a "yes or no" type question; the following routine could be used to prompt the user with an audible tone that a "Y" or "N" was not entered:

```
100 LINE INPUT A$  
110 IF A$="Y" OR A$="N" THEN      RETURN  
120 BEEP  
130 GOTO 100
```

The next new command I see is the CALL command. This is used to call a machine language program in much the same way that the Model I, II, III, etc., uses the USR statement. The syntax of the CALL command is:

CALL address,expression1,expression2

where address is the decimal address of the beginning of the machine language program. Expression1 is optional and, if used, passes an integer argument to be loaded into the "A" register prior to jumping to the machine language routine. Expression2 is also optional and, if specified, will load the HL register pair with the integer number specified; an excellent method of passing the beginning address of an array or stack pointer. If you're planning to write some nifty sorting or block move type of routines in machine language, this is the way to go! This command supplies the machine language programmer with a more useful tool than the familiar USR function in that now two arguments can be passed to the machine language program.

One of the new functions the Model 100 has to offer is CSRLIN. This variable name is reserved to contain the numeric value of the current line position (0—7) of the cursor; this might come in handy if designing a game or drawing program where the user is trying to produce a screen format. A couple of other new variable names are DAY\$ and DATE\$; these contain the first three letters of the day (Mon, Tue, etc.) and the day as MM/DD/YY respectively. Incidentally, these (DAY\$ and DATE\$) can appear on the left side of an equation to set the day and date.

The FILES command lists to the video display all Model 100 files that are stored in RAM. This is just like issuing a DIR command from TRSDOS for you TRS-80 disk drive owners. It is interesting to note that the Model 100 treats everything—program, data file, text file—as a sequential data file. This means, oddly enough, that when you are in BASIC and are working on a previously saved program, it is an OPEN file! You see, the RAM in the Model 100 is a sort of combination RAM and disk drive. Therefore when you type FILES, the program that you are working on has an asterisk displayed to the right of it, indicating it is currently an open file. A word to the wise: don't attempt to KILL the program you are currently working on. As it is an open file, the "operating system" (if you'll pardon the expression) won't let you KILL it. Instead, type NEW, and then KILL "filename."

For those of you familiar with the MEM function, the Model 100 uses a

different, yet not unknown, command: FRE. If used in the form X=FRE(0), the variable "X" will contain the amount of available memory remaining. When used as X=FRE(A\$) or X=FRE(""), the variable "X" will contain the amount of unused cleared string space.

Another new command is HIMEM. This reserved variable contains the address of the highest location in memory available to BASIC. As with DAY\$ and DATE\$ described earlier, HIMEM can appear on the left side of an equation to set the top of BASIC memory—a must for the machine language programmer if he wants his code

and it works like this: X1,Y1 and X2,Y2 are the X and Y coordinates of the pixels on the Model 100 LCD display. There are 240 pixels across and 64 down, so any X coordinate must have the value 0—239, while the Y coordinate must contain a number in the range 0—63. The "switch" parameter, if used, indicates how the line, or box is to be drawn. If the value of switch is odd, BASIC will set the pixels—that is, it will make the pixels dark. If switch is even, it will reset or clear the pixels. If "B" is used, a box will be drawn using the X1,Y1 and X2,Y2 coordinates as corners of the box. If "F" is specified, the box will be filled (or unfilled) as

"... It is interesting to note that the Model 100 treats everything—program, data file, test file—as a sequential data file. This means, oddly enough, that when you are in BASIC and are working on a previously saved program, it is an OPEN file!"

protected!

The KEY command allows the eight function keys on the Model 100 (labeled F1-F8) to be customized. For example, the statement:

KEY 1, "PRINT FRE(0)" + CHR\$(13)

will display the amount of free memory available whenever the F1 key is pressed. This can be entered as an immediate command or may appear as a line of code in a program.

There's a simple command for copying the LCD (liquid crystal display) to a printer: LCOPY. This will copy a display (ignoring graphics symbols) to an attached printer.

Now we're going to get to the good stuff, namely the LINE command. I'm used to programming primarily on a Model 16, so I don't have the luxury of you CoCo owners of a command such as LINE. But the Model 100 LINE command is something else. Not only will it draw a line from point A to point B, but it will also, if requested, draw a box, and even fill it in! The command syntax is

LINE (X1,Y1)-(X2,Y2),switch,BF

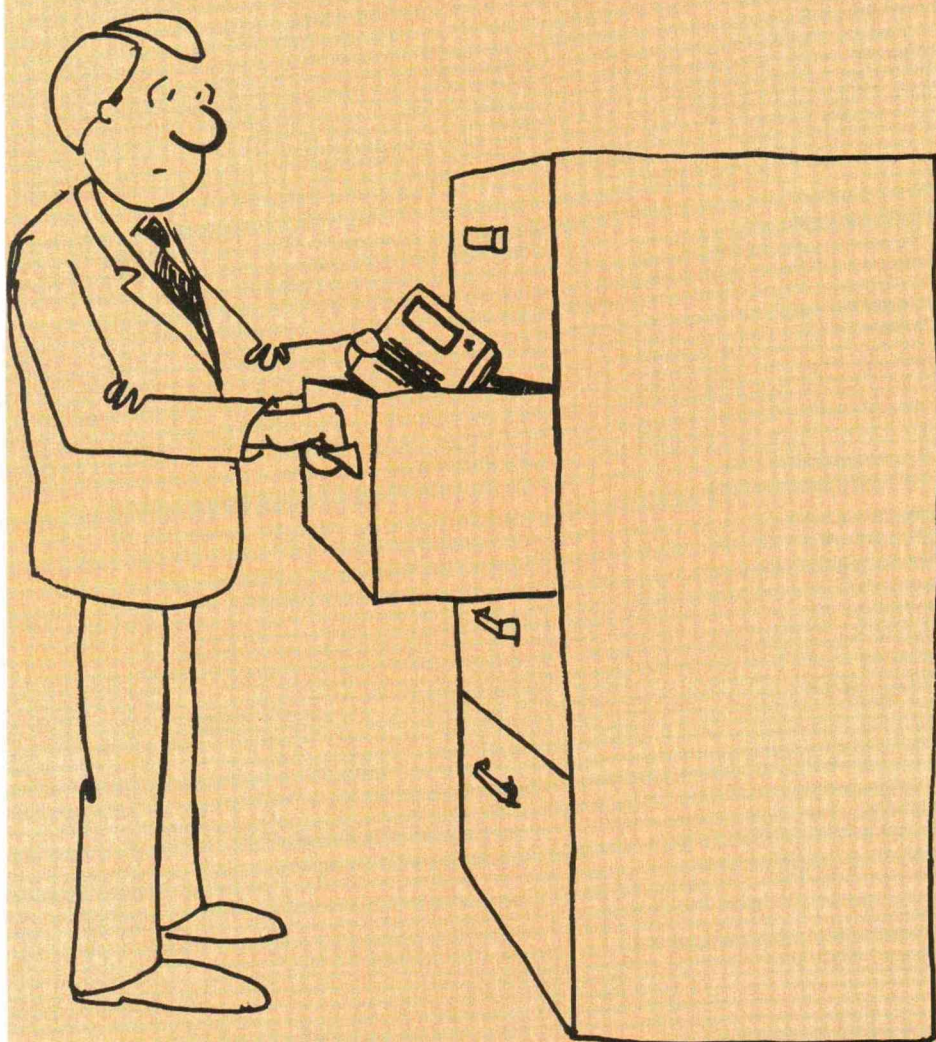

specified by "switch." This command is going to be a real winner with those of you interested in designing graphics programs. Watch for an example of this command in the next issue of *PCM*.

The last command I'm going to review today is the SOUND command. It has the syntax: SOUND pitch,length. The variable "pitch" is a numeric value in the range of 0—16383; "length" must have a value of 0 to 255, with 50 equaling approximately one second. The Model 100 manual provides a very nice table covering the pitch values needed to span five complete octaves, including sharps. The SOUND command will be discussed further in the first installment of "The Music Box," a regular feature which will make its debut in the August issue of *PCM*.

We've tried here to give you a sampling of some of the new commands available to the Model 100's BASIC interpreter. All in all, PoCo's version of BASIC can be summed up as an old friend with a fascinating variety of new commands to give the BASIC programmer the tools needed to make the Model 100 operate easily and efficiently.

**PCM**

# File Sorting Can be Good, But Beware of Pitfalls

**T**here is an excellent program in the appendix of your Portable Computer manual which shows you how to sort document files (those with a .DO extension). But, there may be two problems with the program and you are advised to take care before using it.

The main problem is a human one, based on the principle that we all make mistakes. Many times we find a program will not "run" simply because we have made an error in typing it into the computer.

(PCM is attempting to help fight this problem by printing all of our longer listings in 40-column format—the same as your screen display. You can "line up" the characters one beneath another and that will help you check to see that you have typed them correctly.)

The second problem is the program, as written, uses up quite a lot more memory than is necessary. This is because there are a great number of REMark statements in the sample program — and they use memory. While excellent for debugging and learning,

most of them can be eliminated to save memory space.

However, there are a couple which are important to the running of the program. Since this is the most simple problem to address, we will talk about it first.

### Saving Memory

Every line which begins with an apostrophe (') can be eliminated from the program listing which begins on page 202 of the manual, "Sample Session #3: Sorting .DO Files With A BASIC Program", *except* for the following:

```
2000 '  
3000 '
```

The reason these two lines cannot be eliminated is because they are used to call subroutines in Lines 1130, 1300, 1320 and 1610. If you eliminate these two lines, the subroutines will have nowhere to go, and you will get an ?UL ERROR.

An alternate way of handling this would be to change all of the GOSUB 2000 commands to GOSUB 2030 and the GOSUB 3000 command to GOSUB 3030. Take your choice, but it is usually easier to leave in Lines like 2000 and 3000 as dummy lines. It also makes your programming cleaner in that you begin subroutines on even numbers.

### Beware The KILL

Of greater concern is Line 1645, which tells the Portable Computer to KILL the old file before the new file is written.

The fact of the matter is that by the time you get to Line 1645, you are in the last stages of your program, and the chances that you have done something wrong are pretty small. But, Murphy's First Law ("If Anything Can Go Wrong, It Will") probably applies in computer programming more than anywhere else in the world. And this is a perfect example of how old Murphy can run rampant through your RAM!

For the sake of discussion, let's just assume you typed in Line 1650 with an error — you just hit the wrong key or something.

The program would have KILLED your old document file in Line 1645, but then would break out of program execution at Line 1650 because of the error. And, as soon as you edit the offending line, you lose the array which has all the information in your document file stored in memory.

Have you got troubles?

Suppose you spent two hours putting

in names, addresses and telephone numbers into an ADRS.DO file the day before. Then, you decided to sort it with this program. All of a sudden, Murphy has wiped out your two hours worth of typing in one fell swoop of a ?SN error.

What you have to do is make sure your sorting program works exactly right before you try it on any "live" files. Or, you have to make a backup copy of the original file.

Making the backup is easier, but not as much fun. All you need to do is type in CSAVE "ADRS" ENTER and your file will be saved on tape. Then, if the worst happens, just re-load the file back into memory with CLOAD "ADRS" ENTER.

But there is another way to do it, too. And you can have more fun with that.

### The Fun Way

What we need to do is create a test file

dle each series of letters the maximum number of times.

Now, run the sorting program from BASIC. But, instead of using the ADRS file, use the TEST file. If you have an error that ends up killing your source file, all you need to do is create another one — something that can be done in a minute or two. And, that will save you from any problems with your data in the ADRS file.

Once you have the sort working to perfection with your TEST data, just type in KILL "TEST.DO" and run the sort program using your ADRS file.

### More Goodies

There are some other things you could do with this program—or the general outline of the program—with just a little modification. One of the most handy, it seems to us, is to print out the contents of the entire file. This

*"... Murphy's First Law (If Anything Can Go Wrong, It Will) probably applies in computer programming more than anywhere else in the world."*

and then use that for debugging the sorting program. Go to the main menu and call up the TEXT program. This will allow you to create a file for testing the sorting program.

Since this is going to be a test, call the file TEST. Then, type in your own text file.

We suggest using two or three letters of the alphabet for each listing. So, your TEST file might look like this:

```
ZZZ  
YYY  
FFF  
TTT  
QQQ  
HHH
```

You can, of course, use as many of the letters of the alphabet as you want. But do not type them in in alphabetical order.

In fact, to see how fast you can sort them under a "worst case" situation, type the alphabet exactly backwards. That will require the computer to han-

would involve changing the write to RAM subroutine (Lines 1645-1690) to a printout subroutine. That way you could get a printout of the entire document file and, if you had sorted it first, you could have a sorted printout.

Assuming your file is structured in the manner which is suggested by the manual, you would also be able to change the way the file is set up. As an example, let's just suppose the first ten spaces are set up for a last name, the next ten for a first name and initial and the next eleven for telephone numbers. You could rearrange the way the file is constructed, using some of the string handling commands such as MID\$, LEFT\$ and RIGHT\$. And, of course, you could print out the rearranged file — without even disturbing the original file, if you wished to do so.

We are very impressed with the construction of the two data base files built into the Portable Computer and believe there will be many applications which will prove useful to its users. 

For coffee breaks or unavoidable waits, you can take this little game along. But, be warned, you won't always win when you try to . . .

# Match Wits With Nim

All work and no play makes even a Portable Computer owner a dull person—so we offer you a little recreation along with all the serious-type goodies that grace this, our first issue of *PCM*.

In fact, recreation will be a part of *PCM* each month. When you need a little respite from the business trip, if you finish your memos before the plane lands, or in case you just want to *play*, we hope that these recreational moments will be a lot of fun for you. Look for them to become a regular part of *PCM*.

And, what better way to start than with a “traditional” computer game that will, on one hand, show how smart your Portable Computer is and, at the same time, show off some of its graphic capabilities. The name of the game is *NIM*, and we're willing to bet that you can't beat the computer (but you might).

*NIM* is based on the simple principle that you and your opponent each take turns at taking one or more little people away from one of three rows of figures. You can take all of the people in a certain row—or only one of them. The winner is the one who is successful in taking the last person or people. You cannot take people from more than one row at a time, so, as you see, there is a bit of planning involved.

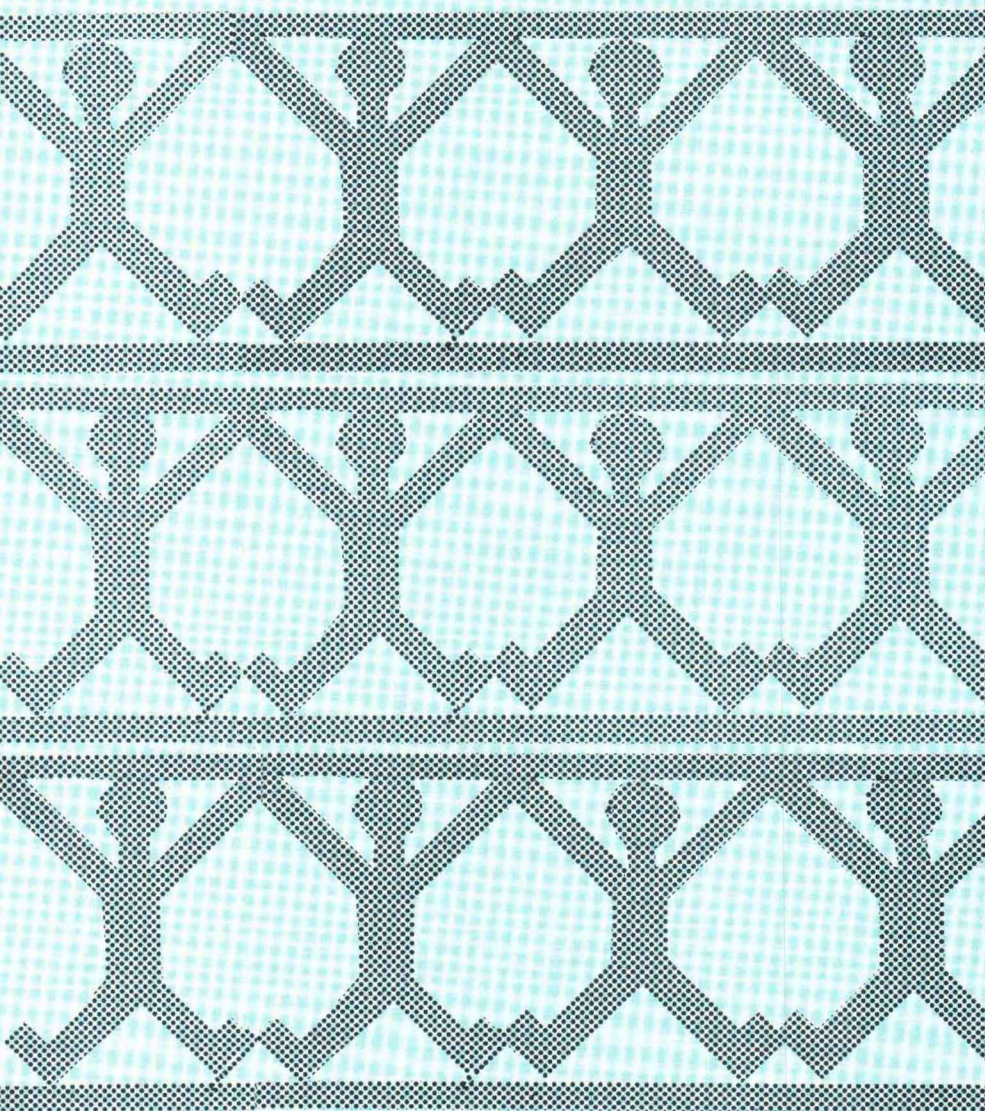

The computer starts out real friendly, asking you whether you want to go first or not. But, then, it starts playing in earnest and won't give any quarter. See whether you can win.

Note that you do not have to press the ENTER key to make any of your commands work. This version of *NIM* uses a special INKEY\$ routine that lets you just enter a response in most cases. When you do have to press ENTER, the program will tell you.

Don't expect to win the first time out. But, you will have an option to play again. If you choose not to play again, the program returns you to the Model 100's Main Menu.

The people rows are numbered from top to bottom, with row one being at the top. There are seven people in row one, five in row two and three in row three.

Good luck!

The listing:

# This Test Will Help Your Kids

One of the best uses for a microcomputer is its ability to drill youngsters in basic fundamentals. The program listed below, *TEST*, is a perfect example of a simple way to accomplish the drilling process with your Portable Computer.

The program will easily run in an 8K system, provided you don't try to cram too many questions and answers in the DATA statements. In addition, it's a good way to get some of the younger members of the family involved in computing.

Two areas of the program will require some intervention by you. The first is in Line 400, where the number of what we call "Data Pairs" are set. As you will see in the listing, Line 400 is set to three of these data pairs. To expand the program, merely change the 3 in Line 400 to the number of questions you want to ask.

The other area is, of course, in setting up the questions and answers. One question and one answer constitute a "Data Pair." In each pair, the question is given first, then the answer in the

format of a DATA statement.

In the *TEST* program, the DATA lines begin with Line 600 and look like this:

```
600 DATA "SPELL Four","Four"  
610 DATA "SPELL Five","Five"  
620 DATA "SPELL Six","Six"
```

What is happening here is that Line 600 is the first question, which is "SPELL Four." The answer is, of course, "Four." If the test-taker spells the word correctly, the Portable Computer will print "CORRECT." If spelled wrong, it will print "INCORRECT" and the correct spelling of the word. The test-taker also has the option of determining how many questions he/she will be asked.

We have arbitrarily decided to enclose the questions and answers in quotes in the DATA statements. This is *not* necessary for a question and answer format of this sort. However, if either the questions or the answers are to contain commas, then it will be *necessary* to use the quotes. The reason for this is

because BASIC recognizes a comma as setting apart items in a data list.

In other words, you do not have to put just one question and answer on a line. You could just as easily use this construction (and we will eliminate the quotes here for illustration):

```
600 DATA Spell Four, Four, Spell  
Five, Five, Spell Six, Six
```

Both constructions work the same way, provided you do not use commas in the questions or answers.

## Pitfalls

The primary drawback of a program of this type is that it requires the test-taker to answer the question *exactly* as the programmed answer. This is, frankly, excellent for foreign language word drill, math programs and testing things like history dates. It can be used very effectively in spelling, too, provided the student knows the definition of the words. Then, the question should be the definition, and the test-taker must type in the answer with the correct spelling.

Because of this, the program is not particularly suited to asking a student to define a word, unless the definitions are simple. For instance, if the student were asked for the event which occurred in 1066, and you had programmed the answer to be "Battle of Hastings", a response of "The Battle of Hastings" or, even "Battle Of Hastings" (large "O" on "Of") would be judged wrong by the computer. This could be frustrating to a test-taker, especially when the program features a "score" at the end.

A better way to handle this would be to have the computer ask "When Was The Battle of Hastings Fought?" and let the test-taker respond with "1066." Computers *are* literal.

### Backwards Questions

The random question-generating feature of this program eliminates one of the biggest problems encountered with students who drill themselves—they don't memorize answers; instead, they memorize the *order* in which the answers come. By randomizing the questions, this is not possible for them to do.

However, many students also memorize answers one way (forwards) and not the other (backwards). As an example, a student may know that "gracias" means "thank you," but may not be able to answer the question the other way—as in "How do you say 'Thank You'?"

Backwards questions can be easily programmed in by including them twice, simply reversing the question and answer in the data pair. An example of this technique is:

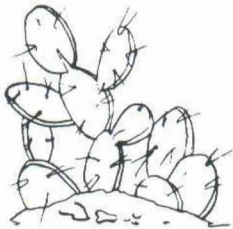

```
600 DATA gracias, thank you, thank you, gracias
610 DATA casa, house, house, casa
```

We have used this program to drill in French with an appreciable increase in student vocabulary test scores.

## QUALITY PROGRAMS FOR YOUR MODEL 100

PROGRAMS REQUIRE 16K EXTENDED BASIC FOR TAPE, AND 32K DISK UNLESS OTHERWISE NOTED.

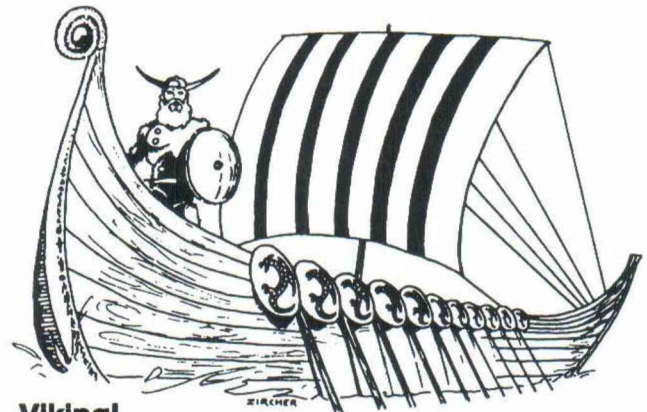

### Monsters & Magic

The most realistic fantasy role-playing game yet for the Color Computer. You start out by rolling up your character's basic ability scores and buying equipment. When you are ready it's into the dungeon. Your character starts at first level, but can rise in levels by garnering experience in the fray. If you have role-played fantasy games you will be amazed at the realism of the combat system. Armor class, initiative, and damage by weapon type are all included, with over 50 different monsters to fight - each with it's own abilities. As you rise in level you can win treasure and find magic weapons and spells - if you live!! You set the game length by telling how many monsters you want to fight before you reach your final battle to the death against the powerful Dungeon Lord. There are 1000+ place description combinations in this text based game, and real excitement in every one! This is a fantasy simulation, and is truly not like any adventure game you have ever seen. For 1 player; requires 32K extended BASIC. **TAPE - \$19.95, 24K**

### Astrology

Truly a classic, this program will accurately cast your complete horoscope. You just enter the date, time, and place of birth. The sun sign, rising sign, mid heaven (MC), lunar nodes, and planetary influences including houses and aspects between the planets will all be calculated, and a full chart drawn. You can also do progressed charts and transits. It will even tell you the day of the week you were born. The accompanying book will help you interpret this chart of your horoscope. The extent of the documentation is tremendous, even by our exceptionally high standards, and no previous knowledge of the subject is required. You can share in this wisdom which has been used for thousands of years in many cultures. This program was written by a professional Astrologer. Please specify 16K or 32K system. **\$34.95 tape - 16K**

### Viking!

A simulation for 1 to 4 persons. Each begins as a land-owner, and by farming their land, buying and selling land, expanding their fishing fleet, building on to their manufactory, increasing their population, equipping and training more soldiers, and regulating their taxes, each player tries to increase their economic power and rank until one becomes ruler over all. But beware plagues, rats, raiders, revolts, bad weather, and other misfortunes which may lie along the road to success. As you progress, see the map of your holdings increase. Playable in 1 to 2 hours, and different every time, you may have an addiction problem. **\$19.95 tape - 24K**

### Gangbusters

If you ever wanted to try a life of crime, this is your chance. You will start out as a Punk, but by using brains, and a little muscle, you can rise to become a Hood, Runner, Bookie, Torpedo, Fence, Kingpin, or win by becoming Syndicate Boss. Indulge yourself. Bribe a judge, or the District Attorney. Pay off the Cops. Take out a contract on another player, but watch out, they may be after you. Buy trucking companies, bootleg operations, houses of ill fame, but remember, if you get caught, you may do some hard time. Do you have what it takes to take over? This game will keep you close to your rod, get you thinking about bulletproof glass in your car, and definitely bring out the worst in you, but you'll love every minute of it. For 2 to 6 players, takes about 2 hours to play. Every game is excitingly different. **\$19.95 tape - 24K**

Your personal check is welcome - no delay. Include \$1.50 shipping for each program ordered. (Shipping free on \$50.00 or larger orders). AZ residents add 7% sales tax. Orders shipped within two days.

## On The Road

By Robert Frowenfeld  
PCM Contributing Editor

The emphasis of this column will be on programs that can be used when the Model 100 user is exactly that: on the road. Away from plotters, printers, telephones and the like; out in the wilderness, perhaps with nothing around you except the hum of the bees. Whether you're on a plane, or just simply want to relax with your PoCo, this column will provide you with both interesting and useful programs. Our first article for "On The Road" will make the Model 100 generate a loan amortization schedule.

Say you want to buy a car, or a house, or maybe you're wondering how much money you can borrow if you're willing to plop down \$250 a month for six months to buy your girl the diamond ring she swears she won't marry you without. Well, this program will do it all for you. It's a loan amortization program—the same type used by financial institutions (and your local friendly car dealer) to determine the periodic payments as well as principle and interest credits during the life of a loan.

The program listed below can be used in one of three ways: to find the periodic payment, to determine the amount of money that can be borrowed (loaned), or to compute the number of periods to repay a borrowed (or loaned) amount of money.

*(Robert Frowenfeld owns his own computer programming firm in Louisville, Ky., and has completed his graduate coursework in Computer Science at the University of Louisville.)*

In each instance the interest rate must be supplied; it is always typed in as a whole number, not as a percentage. For example, if the interest rate is 12.5 percent annually, it should be entered as 12.50 and *not* as 0.125. After the input is complete, the program prints out an amortization schedule, breaking down each period's payment into its principle and interest components. This comes in handy at tax time when you need interest payment figures for your itemized deductions. At the end of the program are printed totals for the amount of principle and interest paid out over the entire life of the loan.

When it is required to compute the periodic payment, the user must enter the amount of the loan (the principle) and the number of periods required to repay the loan. You will notice that I constantly refer to the time between payments as "periods" and not "months." There's no particular reason for this other than the fact that nowhere is it written that a payment occurs once a month. It could be once a quarter, once a week, or once a year. The program *does* assume that there are 12 payment periods per year, but this can be changed by redefining the variable "PY" on line 15 to be the number of payment periods per year.

The second way the program can be used is to determine the amount of money that can be loaned or borrowed. The information required here is the amount of money to be paid in each period and the total number of payments. This method can prove to be

rather handy.

The last mode of running this program is to supply the loan amount along with the required payment to compute the number of pay periods.

An example of each of the three modes of operation is illustrated below, but first a quick lesson in algebra to show how the program works. The basic formula for computing the periodic payment is:

$$P = V / ((1+I)^t(-N)) / I$$

Where: P = periodic payment  
V = loan value (principle)  
I = interest rate (per period)  
N = number of periods

\*\*Note: the character "t" means "raised to the power."

Solving this equation for 'V,' the principle yields the formula:

$$V = P * ((1-(1+I)^t(-N)) / I)$$

In order to solve for the number of periods (given the principle 'V' and the payment 'P') requires some fancy footwork. The variable 'N' is used as an exponent in the equation and therefore the log of both sides of the equation must be taken. Using the first equation above yields:

$$P = V * I / (1 - (1+I)^t(-N))$$

This reduces to:

$$V * I / P = 1 - (1+I)^t(-N)$$

which becomes  $V * I / P - 1 = -(1+I)^t(-N)$

Taking the log of each side:

$$\text{LOG}(-(V * I / P - 1)) = -N * \text{LOG}(1+I)$$

And finally:

$$N = -\text{LOG}(-(V * I / P - 1)) / \text{LOG}(1+I)$$

This is performed by lines 300-310 of the program.

One last note: The variable 'PTS' is

initialized on line 15 to a value of 'N'; if a printout is desired along with the video output, change this value to 'Y.'

Well, there you have it. Follow the example below and give it a try with your own numbers. Who knows? Maybe you can afford that new house after all!

Interest Rate : 10.00%  
Loan Value : \$ 2,000.00  
# of Payments : 24  
Monthly Payment: \$ 92.29

## SOFTWARE

### Blockade Requires Some Fast Fingers

Aha, a game for the Portable Computer. A game? Yes, a game.

Actually, *Blockade* is the first of a package of several games from Silverware, the same people who are behind the very popular *Chromasette* and *CLOAD* tape and disk "magazines" for the Models I, III and Color Computer. As usual, their offerings are good.

I believe that *Blockade* proves that there will be no problem with games for the Portable Computer. This one is patterned after an arcade-type game and I want to say that it takes a bit of practice to get going. Even after that happens, *Blockade* is a challenge!

The game is simple in principle: You are a little snake on the screen and, using four keys, can move up or down, left or right. The object is to "hit" little

targets as they appear randomly on the screen. They remain for random periods of time, too.

Each time you do manage to "hit" a target, you get a number of points. And, while this sounds easy, it isn't. The reason for that, simply, is because you can't touch the sides of the screen nor can you "doubleback" on yourself.

Now, this may sound easy, but it is not. And, that is especially so because, as the saying goes, the better you get the more difficult things get to be. In short, your little snake grows to be a big snake as you begin to accumulate points. You run into the ever-increasing danger of doubling back over yourself — thereby losing points and moving closer to the end of the game.

*Blockade* can be played with one or two players and has three levels of difficulty. That makes it a handy way to learn and impress your friends at the office (or your seatmate on an airplane).

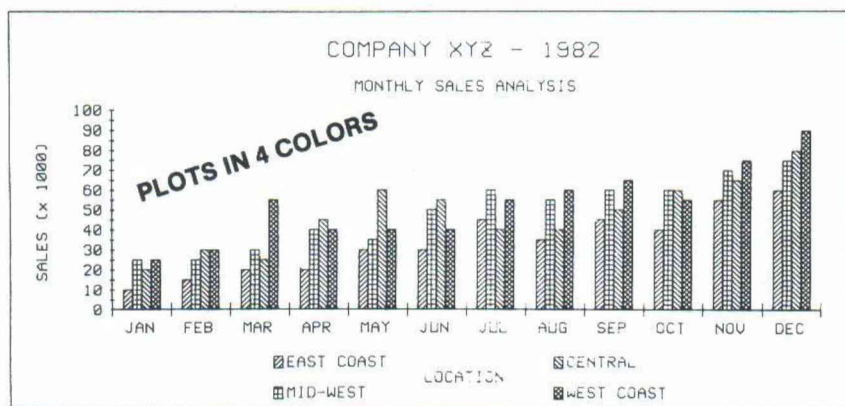

You lose five points when you run into something other than a target — be that the side of the board, your own snake or the other snake. You get a random number of points for each target hit. And the first person to reach 100 points wins. However, the first person to get minus-100 points loses, so you can win *Blockade* without reaching 100 yourself.

The one-player game is a real challenge and the two-player game can get fast and furious. All in all, *Blockade* is fun to play.

*Blockade* comes on a tape with three other offerings, *Reversi*, *Frankenstein Adventure* and *Alexis Adventure*. All are specially formatted for the Model 100 and the remainder will be reviewed in future issues of *PCM*. Stay tuned.

**Silverware, P.O. Box 21101, Santa Barbara, CA 93121, \$24.95 plus \$1 shipping with three other games on same tape.)**

## It Doesn't Cost A Lot To Plot with QuickPlot®

We've just given the CGP-115 Color Plotter business status. With QuickPlot, your TRS-80 or IBM-PC can produce high quality line-, bar-, and pie-charts in vivid color. Simple data entry and flexible chart formatting makes QuickPlot and the CGP-115 Color Plotter the logical choice for the professional who wants to **plot** his profits—not spend them.

Complete QuickPlot Package Includes: Bar Chart, Pie Chart, and Line Graph. Data and chart formats save to disk for future plotting.

Model II/12/16 ..... \$89  
 Model III/4 ..... \$89  
 Model 100 ..... \$49  
 IBM-PC/XT ..... \$89

Now **you** have a friend in the software business.

## Your Perfect Portable Companion

Now, here's your opportunity to have **PCM — The Portable Computing Magazine** delivered to your home or office each month!

**PCM** will bring you the finest and most up-to-date information available anywhere for your TRS-80 Model 100 Portable Computer. Whether your interest is programming, using the Portable Computer's fabulous built-in functions or communicating with other Portable owners, **PCM** is for you.

Each month we'll bring you a host of articles, ready-to-run programs for business and professional use or just plain fun. And each article will be in an easy-to-read style...not computerese.

Subscribe to **PCM** today! A dozen issues are only \$28 (\$35 in Canada and Mexico).

## MORE THAN JUST ANOTHER PRETTY FACE.

Says who? Says ANSI.

Specifically, subcommittee X3B8 of the American National Standards Institute (ANSI) says so. The fact is all Elephant<sup>TM</sup> floppies meet or exceed the specs required to meet or exceed all their standards.

But just who is "subcommittee X3B8" to issue such pronouncements?

They're a group of people representing a large, well-balanced cross section of disciplines—from academia, government agencies, and the computer industry. People from places like IBM, Hewlett-Packard, 3M, Lawrence Livermore Labs, The U.S. Department of Defense, Honeywell and The Association of Computer Programmers and Analysts. In short, it's a bunch of high-caliber nitpickers whose mission, it seems, in order to make better disks for consumers, is also to

make life miserable for everyone in the disk-making business.

How? By gathering together periodically (often, one suspects, under the full moon) to concoct more and more rules to increase the quality of flexible disks. Their most recent rule book runs over 20 single-spaced pages—listing, and insisting upon—hundreds upon hundreds of standards a disk must meet in order to be blessed by ANSI. (And thereby be taken seriously by people who take disks seriously.)

In fact, if you'd like a copy of this formidable document, for free, just let us know and we'll send you one. Because once you know what it takes to make an Elephant for ANSI...

We think you'll want us to make some Elephants for you.

## ELEPHANT<sup>TM</sup> HEAVY DUTY DISKS.
